

# Entry level server network

True server networks provide greater security and reliability, more efficient resource sharing and a stronger platform for growth than standalone PCs or peer-to-peer networks of 1–5 users.

The entry-level server network – ideal for between 5–50 users – provides faster access, multi-user processing, the ability to share resources, greater expansion possibilities, RAID securities on the disk and continuous operation. It enhances internal and external communication, collaboration and management with the Windows Small Business Server 2003. Plus, it enables seamless connection to reliable backup technologies for data protection.
